

HOW TO WRITE YOUR AMAZING EXPERIMENTS

In only 3 slides

First Step: Observe & Hypothesise

- First you need to clearly state your **objectives** and **hypotheses**:
- **Objective:** What do I want to know and why it is interesting?
- **Hypothesis:** What do I expect to find?

Second Step: Experiment

- Then you need to clearly enunciate the experiments you will perform. This means that you need to:
- State very clearly which **variables** you are going to experiment with, why, and how.
- State very clearly the **measures** you are going to use to evaluate the results of your experiments and why you use them.

Third Step: Analyse & Conclude

- Finally, now that you have the results from your experiments you need to:
 - **Analyse:** Provide systematically the results you obtained and comment what you have learnt from them.
 - **Conclude:** Did you achieve your objectives? Do the results corroborate your hypotheses or go against them?
-
